Nathanial Schaffner
Tokenizer

This program tokenizes input from the command line.

A list of tokenizing separators is provided at argv[1], and a token stream to be separated is provided at argv[2].

If the number of command line arguments does not match the format, an error stating correct usage is printed.

Note: not all test cases work properly. I'm not sure what is causing this behavior, but I've run out of time to continue debugging.
